

Direct Export Providers

Many information provider web sites include a direct export option that allows you to send copies of references directly to an EndNote library. The direct export process automatically selects an EndNote import filter to map bibliographic information into the appropriate EndNote fields. All you need to do is select the EndNote library into which the data should be imported.

Note: In some cases, you may be required to select an appropriate filter. When the direct export process is started, EndNote first checks the file for tags that are specific to a common import type, such as the EndNote, *Web of Science*, or RIS format. If no match is found, EndNote searches through all filters for a vendor ID and database ID that match the file. If no match is found, you are prompted to select a filter.

The systems listed below provide a direct export of references into EndNote. At the time this file was created, these were the current instructions for each information provider listed in the table. If you find that these formats have changed, please check the documentation from your information provider or contact us.

This is not a complete list, and the number of providers keeps growing, so check with your information providers to find out whether they participate!

Note: UTF-8 (Unicode) is the default character encoding for text, XML, and HTML export from the product. RTF uses ASCII encoding for ASCII characters and "code page escapes" to encode characters beyond ASCII.
